Geochemistry

Webtrieve™ API

The bridge between ALS and your data repository.

Advantages:

› Minimises human intervention, no need to check for new results and load to a database allowing for real time access to results.

› Standardisation of data workflow as each transfer is consistent.

› Automated sample submittal process.

› Cloud based infrastructure, with redundancy to disaster proof the API.

› Secure data transfer using the same protocols as Webtrieve™.

› An agnostic connection. To date the API has been effectively implemented between ALS and, MineVision and OSIsoft PI System™.

The Webtrieve™ Application Program Interface (API) has been proven robust as it is used with the ALS Geochemistry Mobile App. It is also currently in place with several major groups for data transfer of exploration results, mine site process/mill/grade control results and sample submittal.

Real time data integration

If you are interested in streamlining your workflow using the Webtrieve™ API please contact our client services team to facilitate contact with our software development team for technical details.
