

Keep your process in check

with the new **ALS Control Alerts** app.

The new Control Alerts service for ALS Mine Site clients allows plant managers and operators to receive SMS and/or email alerts when a routine analytical control returns out of bounds results.

React immediately to low recovery in the cyclone overflow or over limit metals in tailings or water treatment, minimize negative events, and improve your process with ALS Control Alerts 24/7 monitoring.

Key features:

- Secure access to all grade control, mill processing, and environmental samples analysed by ALS
- User-defined graphical and alert limits for any analyte
- Full audit trail record of all changes to limits
- Browser-based ALS Webtrieve™ and Android/iOS app options for administering limits
- Summary statistics and time series graphing for convenience

Ask your preferred ALS contact about setting up Control Alerts for your analytical control points.
