LEADING PROVIDER OF ANALYTICAL GEOCHEMISTRY SERVICES

ALS geochemistry services during lock-downs and quarantines

To our valued clients

During this challenging time, we want you to know that while being focused on staff health and safety, we are striving to maintain all the essential functions, services and operations that you expect. At the same time ALS will comply with any local orders or requirements in the interest of public health and the health and safety of our employees and customers.

In this rapidly developing situation, we will continue to evaluate our processes and communicate relevant changes in our day-to-day operations where they may affect service. As at the end of March 2020:

All the regional laboratories remain in operation.

- In most countries, we will be able to move samples to alternative locations for sample preparation and analysis if service suspensions should be experienced.
- Our mine control laboratories will continue their work to keep the mines, metallurgical plants operational and provide mine-related environmental analyses.
- In order to minimize person to person contact we urge you to leave your samples and paperwork in designated areas outside of the laboratory buildings.
- We'll continue to work together and to adjust our approaches as necessary given the changing condition to safely manage our laboratories while striving to provide the level of services required.

If you require any further information, please contact your nearest ALS location.
